ABSTRACT:

The analysis of student performance in aptitude quiz exam can be done using this application as a mediator interface.

The student details are entered along with the examination center details of aptitude quiz exam. Everyone gets a score card wherein they get the marks of each section and get the result whether they are passed or failed.

The database consists of the student details and the score card of each and every student in that particular list.

Requirement Analysis:

List of tables:

- *Student details*
- *writes/attempts*
- *Aptitude quiz exam*
- *Scores*
- *Marks scored*

List of attributes with their domain types:

Student_details:

NAME:	VARCHAR2(20)
HALLTICKET:	NUMBER (5)
MAIL_ID:	VARCHAR2(20)
CLASS:	VARCHAR2(20)

Apptitude_quiz_exam:

DURATION	NUMBER(5)
HALLTICKET	VARCHAR2(20)
EXAM_CENTER	VARCHAR2(20)

Marks_scored:

LOGICAL_REASONING	NUMBER(5)
VERBAL_ABILITY	NUMBER(5)
QUANTITATIVE_APTITUDE	NUMBER(5)
RESULT	VARCHAR2(10)
SHEET_ID	VARCHAR2(10)

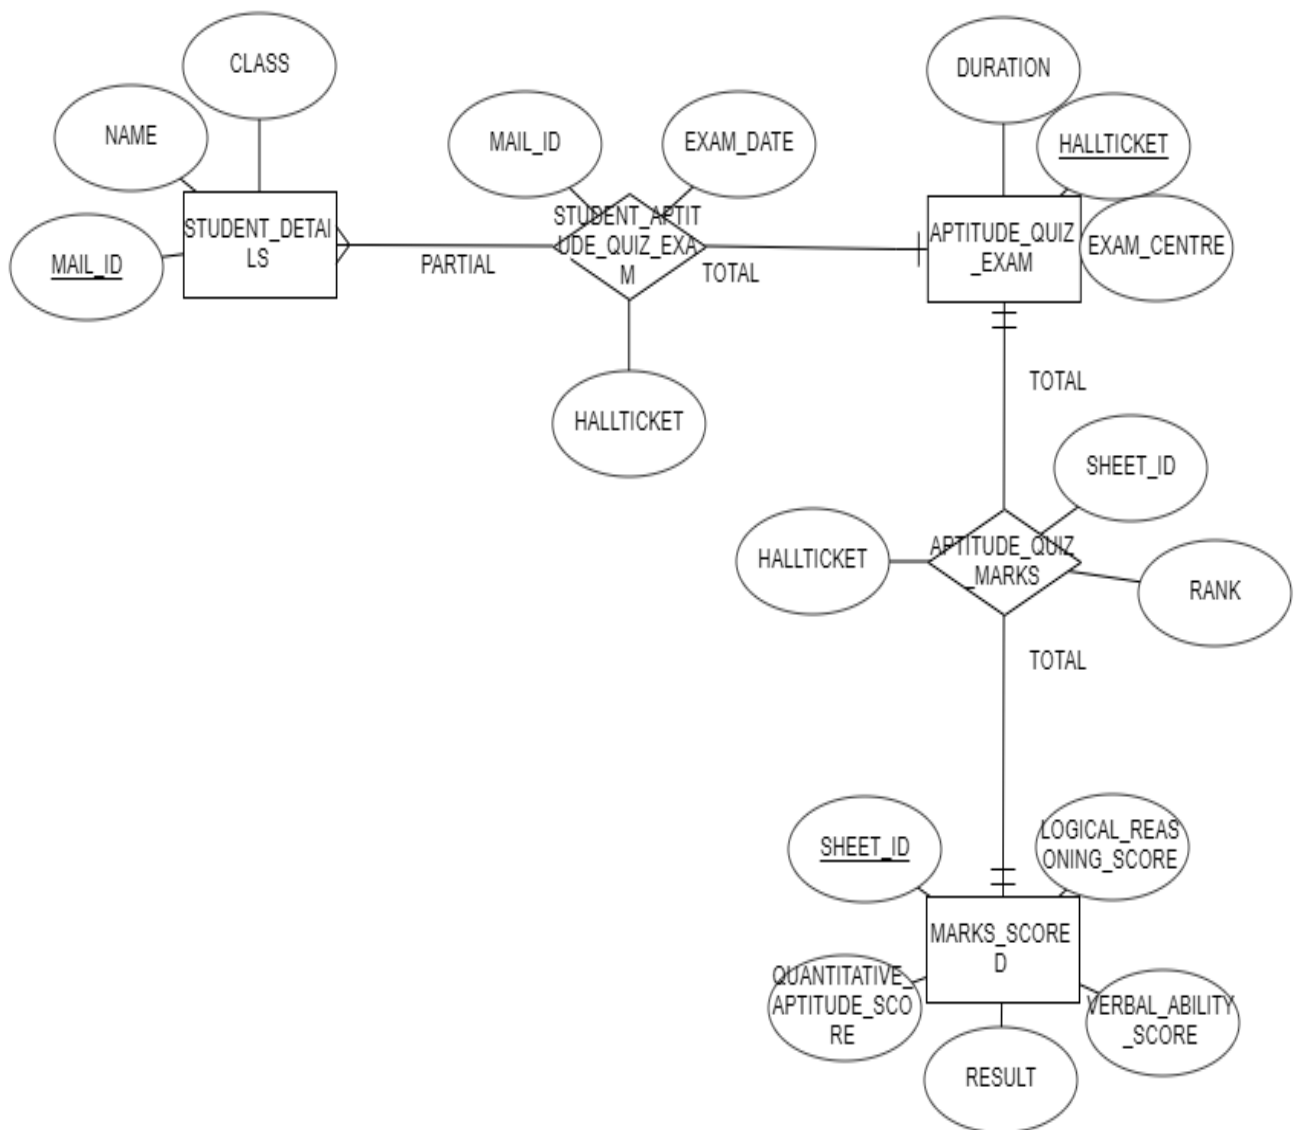

APTITUDE_QUIZ_MARKS:

RANK	NUMBER(10)
SHEET_ID	VARCHAR2(10)
HALLTICKET	VARCHAR2(10)

STUDENT_APTITUDE_QUIZ_EXAM:

EXAM_DATE	DATE
MAIL_ID	VARCHAR2(10)
HALLTICKET	VARCHAR2(10)

ER DIAGRAM:

MAPPING CARDINALITIES AND PARTICIPATION CONSTRAINTS:

- One student can give any number of exams, so many to one cardinality suit writes.
- Each student who writes the exam has one score card, so one to one cardinality suit scores.
- All the students might not write the exam so the student details is partial.
- All the exams written are related to students so it is total.
- Marks scored by students in the exam must be related to the exam so it is total participation.

DDL AND DML COMMANDS:

SQL>create table student_details(

- 2 hallticket number(5) primary key,
- 3 name varchar2(20),
- 4 mail_id varchar2(20),
- 5 class varchar2(20));

Table created.

SQL> create table aptitude_quiz_exam(

- 2 duration number(5),
- 3 hallticket varchar2(20),
- 4 exam_center varchar2(20));

Table created.

SQL> create table marks_scored(

- 2 logical_reasoning number(5),
- 3 verbal_ability number(5),
- 4 quantitative_aptitude number(5),
- 5 result varchar2(20),
- 6 hallticket number(5));

Table created.

```
SQL> create table APTITUDE_QUIZ_MARKS(  
  2 rank number(10));  
  3 sheet_id varchar2(20);  
  4 hallticket varchar2(20);
```

Table created.

```
SQL> create table STUDENT_APTITUDE_QUIZ_EXAM (  
  2 exam_date date);
```

Table created.

```
SQL> desc student_details;
```

Name	Null?	Type

HALLTICKET		NOT NULL NUMBER(5)

Connectivity with the Database:

Java Database Connectivity (JDBC) is an application programming interface (API) for the programming language Java, which defines how a client may access a database. It is a Java-based data access technology used for Java database connectivity. It is part of the Java Standard Edition platform, from Oracle Corporation. It provides methods to query and update data in a database and is oriented towards relational databases.

Block of code for JAVA- SQL connectivity with JDBC:

```
public void connectToDB()
```

```
{
```

```
    try
```

```
    {
```

```
        connection=DriverManager.getConnection("jdbc:oracle:thin:@localhost:1521:orcl","project","vasavi");
```

```
        statement=connection.createStatement();
```

```
    }
```

```
        catch(SQLException connectException)
        {

System.out.println(connectException.getMessage());

System.out.println(connectException.getSQLState());

System.out.println(connectException.getErrorCode());

                System.exit(1);
        }
}
```

TESTING

The program executes three basic operations those are insert update and delete on 5 different tables. Along with this, it

also has an output column which gives information about how many rows have been edited. Errors syntactical or exceptional will be shown if occurred.
